Hyperkalemia Treatment Algorithm

Drug doses:

- IV Calcium 0.1 mmol/kg.
- Nebulised Salbutamol:
Age ≤2.5 yrs: 2.5 mg; Age 2.5-7.5 yrs: 5 mg; >7.5 yrs: 10 mg
- IV Insulin with Glucose:
Start with IV Glucose 10% 5ml/kg/hr (or 20% at 2.5 ml/kg/hr).
Once Blood sugar level >10mmol/l and the K⁺ level is not falling,
add IV Insulin 0.05 units/kg/hr and titrate according to glucose level.
- IV Sodium Bicarbonate: 1-2 mmol/kg.
- PO or Rectal Resonium : 1 Gm/kg.

STATUS EPILEPTICUS

Status epilepticus (SE) is a medical emergency that is associated with significant morbidity and mortality.

TYPES OF STATUS EPILEPTICUS			
CONVULSIVE STATUS	NON-CONVULSIVE STATUS	FOCAL STATUS	ABSENCE STATUS
≥ 5 minutes of continuous convulsive seizure OR ≥ 2 discrete seizures without return to baseline CR repeated seizures for ≥ 30 minutes.	≥ 10 minutes of continuous seizure OR ≥ 30 total minutes of total EEG activity in any given hour. These patients are at risk for convulsive status.	Focal epileptic seizure that lasts ≥ 30 minutes OR repeated focal epileptic seizures (≥ 30 minutes) with incomplete recovery between seizures.	Prolonged, generalized absence seizure that usually last for hours to days. Cardinal symptom is altered level of consciousness.

Convulsive status is the **most common** type of status epilepticus (SE). > 50% of SE episodes occur in children with no prior seizure history.

COMMON ETIOLOGIES OF STATUS EPILEPTICUS		
ACUTE SYMPTOMATIC (17-52%)	REMOTE (16-39%)	OTHER
<ul style="list-style-type: none"> CNS infection Metabolic (hypoglycemia, hyponatremia, hypocalcemia) Hypoxemia Stroke 	<ul style="list-style-type: none"> Hemorrhage Non-compliance with AEDs Overdose Trauma Progressive neurodegenerative disorders Cerebral migrational disorders 	<ul style="list-style-type: none"> Perinatal hypoxic-ischemic encephalopathy Cerebral dysgenesis Trauma Epilepsy Idiopathic (8-19%) Prolonged febrile convulsions (23-39%)

HISTORY

- Seizure history: pre-ictal, ictal, and post-ictal phases. Ask about duration, focal symptoms, preceding events, and use of anti-convulsant medications.
- Past medical history: previous seizures or history of epilepsy or other neurological disorders.
- Family history: seizures or epilepsy.
- Bleeding symptoms: fever, nausea, vomiting, diarrhea, rash.
- Trauma, accidental and non-accidental injury.
- Medications (AED)
- Toxins

PHYSICAL EXAM

- ABCs, vitals, level of consciousness, GCS
- Rule out CNS infections
- General physical exam: source of infection (eg. otitis media, upper respiratory tract, lungs, GI tract, urinary tract, or sepsis)
- Neurological exam
- Indications of baseline

INVESTIGATIONS

- Glucose
- CBC with differential
- Electrolytes
- Ca²⁺, Mg²⁺, P
- Liver function tests
- Toxicology screen
- Anticonvulsant level
- Electroencephalogram (EEG)
- Head CT or MRI
- Urine, blood, CSF cultures

MANAGEMENT OF STATUS EPILEPTICUS IN HOSPITAL

GOAL: stop the seizure and prevent brain injury. Then determine the underlying cause.

1st Line Therapy - 10 minutes

AIRWAY support
BREATHING - assess breathing, 100% O₂, monitor O₂ saturation
CIRCULATION - BP, pulse
Establish IV ACCESS
Repeat GLUCOSE test

Position the child on their side to prevent aspiration.

NO IV ACCESS
Lorazepam (EUC or PR), Midazolam (SUC, IN, or IM), Diazepam (PR)

IV ESTABLISHED
Lorazepam IV, Midazolam IV, Diazepam IV

Monitor, follow-up investigations

Repeat x1 within 5 minutes or switch to IV route

Repeat x1 within 5 minutes

Repeat x1 within 5 minutes

2nd Line Therapy - 20 minutes

2nd line treatment options: Phenytoin IV, Fosphenytoin IV, Valproic acid IV, Levetiracetam IV

If still seizing after 5 minutes: use phenobarbital if fosphenytoin/phenytoin used OR use fosphenytoin/phenytoin if phenobarbital already used.

Seizure stops within 10 minutes? YES: Monitor, follow-up investigations

NO

REFRACTORY STATUS EPILEPTICUS: unresponsive to 2 different anticonvulsant medications (eg. benzodiazepine and phenytoin)

Consult PICU and Paeds Neurology teams for consideration of rapid sequence intubation and midazolam continuous infusion. Monitor ABCs continuously.

This algorithm applies only to infants and children. Management differs for neonates.

May 2020
Katharine V. Jensen (Medical Student 2021, University of Alberta) &
Dr. Natane Lu (Neurologist & Epileptologist, University of Alberta) for www.pediatrics.ca

Initial Treatment Algorithm for Status Epilepticus in Infants and Children

Call Paediatric Registrar/ST
(Call Paediatric Crash Team Ext 2222)

Airway
Breathing: High Flow Oxygen
Circulation
Check Glucose

5 mins after convulsion started:

Vascular Access?

Yes

No

Step 1
Lorazepam
0.1mg/kg
IV/IO

Step 1
Midazolam (Buccal) 0.5mg/kg
Or
Diazepam (Rectal) 0.5mg/kg

If seizure is continuing 10 mins after START of step 1:

Step 2
Lorazepam
0.1mg/kg IV/IO
Place patient in recovery position
Inform Anaesthetic/PICU colleagues
Ensure Senior Help Present

If seizure is continuing 10 mins after the START of step 2:

Step 3
Inform Anaesthetist and Paediatric Intensive Care Unit
Reconfirm it is an epileptic seizure
Phenytoin 20mg/kg IV/IO over 20 min
Or Levetiracetam (Keppra) 40mg/kg over 5 minutes (max. 2.5g)

If seizure is continuing 20 mins after the START of step 3: (START of infusion)

Step 4
Rapid Sequence Induction
With
Propofol 2-4mg/kg IV or Thiopentone 4mg/kg IV/IO
Ensure Paediatric Crash Team & Senior Help Present

Your dog is trying to make you happy by bringing you something special. There's nothing wrong with a dog showing affection, although some people get grossed out by it. To avoid a potty accident, you should take your dog outside. The moment you stop petting, the paw will pop up again. Photo Courtesy: Katrina_S/Pixabay

Some mother dogs eat their puppies' feces in an effort to keep the babies clean. A dog kissing session can last a long time if you allow it, and it can be a daily occurrence. You may also tell your pup to sit before allowing someone to come over and pet it. You are the dog's human, and the animal wants everyone to be clear on that. Raising a Single Paw Dogs are very intelligent creatures, and they try to communicate however they can. If your dog is laying on its side and its feet are moving, the animal is likely dreaming about chasing a bunny rabbit through a field or something similarly exciting. If your dog meets another dog and immediately sniffs its butt, this is totally normal. If your dog raises a single paw in your presence, it could be requesting your attention. You may notice that your dog low growls while looking out the window. If your dog starts whining and you immediately give the animal attention, however, you are demonstrating that whining will get your pet that attention. A favorite pastime of so many doggos. One common way in which cats seek praise is through their hunting instincts. Since you are your dog's whole life, it is important to teach your pet that you aren't gone forever and will come back. If a dog barks excessively, the animal is trying to tell you something, but perhaps not in the most convenient way. Mites are contagious and can be transmitted from dog to dog, so it's important to get your pup checked out as soon as possible if you think there's something else going on. Head Tilting just about everyone knows all about the dog head tilt that will undoubtedly melt your heart. Photo Courtesy: ivanogvod/Pixabay

A dog that is in pain may also whine, so it's important to make sure you pay attention to your dog. Alternatively, a dog that licks or bites its paws on a regular basis could be experiencing anxiety. Ideally, these feelings should be faced head-on from a young age. It's important not to put your dog in any situation where the animal feels unsafe to keep potential biting at bay. Excessive Barking A barking dog is inevitable since that's how canines communicate. Cats tend to burrow into their owners or other animals while dogs tend to be more vocal about their need for affection. Both species of animals need praise. But what happens when your dog barks excessively? Your dog should also stop once it realizes you're not moving. A dog that bites likely feels threatened or nervous. An older dog may chase its tail just because the animal is goofy and being playful. Make sure you use positive reinforcement by way of treats. Whining A dog's whine can mean a few different things. While a dog may growl or bark while in the play bow position, the pup's body language is meant to show you that it just wants to have some fun. It's no secret that dogs love to dig. However, sometimes you aren't lucky and your dog brings you a dead animal, such as a mouse. If the behavior continues, you should call your vet. It may be time to let the dog chill for a bit and catch up on some much-needed shut-eye. If you interfere at the wrong time, you could get bitten. Howling If your pooch hears something high-pitched, like a train whistle, it may try to match the sound by howling. However, each of these species of animals was originally treated to have certain physical characteristics to protect them from things such as their environment and predators. Overall, this is very common and not a cause for concern. Barking at the Door A dog that barks at the door may want to go outside. A dog that licks its paws after eating may be experiencing a food allergy. Most of the time, the dog will bring something from around the house, like your slippers or a favorite toy. Photo Courtesy: Whicherg/Pixabay

A dog may also signify that your dog is anxious or fearful. The behavior is usually caused by a dog being over-excited for a walk. Dogs may also bark at the door if they want to go outside to play, in which case you could appease your pup and go for a run. Dogs may also hump as a way of flirting. It's difficult for a dog to be on guard when laying like this, so you know you have one super tired, super chill pup if you find your dog sleeping in this position. Giving Gifts Dogs bring gifts to their owners as a way to show affection. For domesticated animals, this is often their home and the people they see within their pack. They will consume smaller animals or fish to fulfill their dietary needs. The dog not only wants you to know that it's there, but it also wants to make sure it knows if you leave. While most sneezing in canines is nothing to worry about, a dog that sneezes excessively or with discharge could require a visit to the vet. Most domesticated animals will find ways of communicating their time of hunger with their owners. Most of the time, a dog eats grass for one of two reasons. Try to encourage your pet or even as it to do some tricks to take the pup's mind off the fear. Superman A dog gets in the Superman position when it is completely tucked out but very comfortable. This is no different between dogs and cats. These things can significantly help control your pup's excitement, making meet and greets far more enjoyable for everyone. Biting Biting is how dogs protect themselves. Your pet may also do this to let you know that it's hungry. Barking or Moving Paws While Sleeping A dog that moves its paws or barks in its sleep is most likely having a vivid dream. However, some breeds are now found without these natural features due to artificial genetic engineering. If you are outside, pick up your dog's poop right away. A puppy may chase its tail because it doesn't realize it's attached to the dog's own body. The Superman pose is apparent as the animal has its front paws stretched out and back paws sprawled straight back. Photo Courtesy: LUM3N/Pixabay

It's essential to pay attention to when your dog licks its paws and report that information to your vet. If you notice that your dog's stature is more rigid, however, it's possible that it's having a seizure. The dog has intestinal worms. Your pet is either missing a specific nutrient in its diet or trying to make itself vomit. Photo Courtesy: PublicDomainPictures/Pixabay

A dog resting on your feet may also be a way to mark her territory. Dogs instinctively practice the behavior, especially if they are unaltered. The position usually signifies that your four-legged friend wants to play, and it allows your pet to run quickly at a moment's notice. If you notice any other signs of pain, a trip to the vet may be in order. Separation Anxiety If your dog gets upset when you leave, it probably has separation anxiety. When content, the animal can often be found curled up in a resting position. Dogs may also yawn if you yawn, which further proves the theory that yawning is contagious. If you have a digger in your clan, spend some more time playing fetch. Chewing If your dog is chewing on just about everything in sight, chances are that the animal is having an issue with its teeth. Photo Courtesy: 947051/Pixabay

A play bow invites another dog or a human to interact and, as the name suggests, play. You should talk to your vet about your pup's diet and overall health if the dog is eating grass every time you go for a walk. Eating Feces A dog that eats its own feces is most likely on a medication that isn't digesting properly. Sometimes leaving the television or radio on while you are gone can help as it makes it seem like people are talking in the house. Photo Courtesy: birgl/Pixabay

Excessive barking can be annoying. See what we did there? Learning about your dog's behavior is one of the best ways you can care for your four-legged pal. In these instances, there's nothing to worry about. Joanne Bourne/Flicker

Dogs and cats are from different species of animals, appealing to different types of people. Photo Courtesy: ArtTower/Pixabay

While some people think that dog humping is a sign of hormones, this behavior is often a way of exerting dominance. Need for Affection While each animal has its own way of showing their need for affection, both dogs and cats have a natural need for receiving this type of attention. Your dog may hump another dog, a human or even a toy, but it's usually nothing to be concerned about, even if it is super embarrassing. Sitting or Sleeping on Your Feet Do you ever notice that your dog is continually touching you? Obedience training can help. Photo Courtesy: skeeze/Pixabay

Your dog may take every opportunity to kiss you on the hand, arm, face and even your mouth. From barking to whining, jumping to butt scooting, your dog's actions are something you should pay close attention to. Puppies chew when they are teething, so it's important to make sure you have plenty of toys available, including bones and other teething-specific toys. Your dog may express these feelings toward another dog or a human. Photo Courtesy: Vizslafotozas/Pixabay

A dog that tilts its head while you talk is hanging onto every word coming out of your mouth. Your four-legged bestie may shower you with kisses as a way to show you're its favorite. You should not allow your dog to approach another animal or human if this behavior is present. However, if you don't provide discipline early on, you may find some of your belongings completely destroyed. You should avoid doing this and only give your dog attention when it is not whining. Your pet wants nothing more than to make you proud. Licking Licking is a dog's love language. Some dogs mount or hump in a sexual manner even after being neutered or spayed. Exploring them will give you a more in-depth look as to what each type of animal has to offer. Body Design While there are definite differences between the look of dogs and cats, each carry similar body designs. Once you determine that there is nothing wrong, you can work to correct this behavior. Most of the time, a whining dog just wants your attention. If the barking is excessive, you may want to talk to your vet. Jumping Dogs and jumping often go hand-in-hand. While this behavior is normal, it is a cause for concern. Being consistent in training is vital, as a dog will learn to pick up on whatever cues you offer it. Butt Scoot If your dog is scooting his butt across the carpet, there could be a multitude of things going on. Photo Courtesy: vivros62/Pixabay

Most of the time, a dreaming dog is nothing to worry about. Body Language Dogs and cats have a certain body language that they display. However, if left in the wild or on their own, these animals will find the prey necessary to feed on. This can be an excellent way for a dog to alarm you that company has arrived. You should speak to your pup in an upbeat tone and try to distract it from whatever is causing anxiety. Dog yawns tend to be extremely cute and can even be highlighted with a bit of a bark. While digging is usually not harmful to a pup, you may want to deter your dog from doing so because your pet may get dirty or start digging in places that are off limits — like your garden. Nine times out of 10, your dog does this to let you know that it wants to play. Photo Courtesy: MabelAmber/Pixabay

The best way to do this is by keeping the leash short but loose. However, it's best to avoid this altogether by not offering any table food in the first place. Pulling on the Leash A dog that pulls on the leash while on a walk needs training. The position is seen in dogs of all ages, but it's most often seen in puppies. Photo Courtesy: StockSnap/Pixabay

A dog sleeping in the Superman position isn't on high alert and is totally relaxed. While eating feces isn't considered harmful (unless your dog has worms), you should deter your dog from doing this. Even though each species has its own distinct looks and characteristics, they do have some common traits as well. Both have provided services and companionship to humans for many centuries. Whatever the source, you should keep your dog away from whatever the animal is fixated on. If your dog uses a pad, try to distract the animal right after it poops. Humping Dog humping isn't usually a cause for concern. While most things your pup does are nothing to worry about, noticing the signs and symptoms that something may be wrong are very important. The Play Bow A play bow is when your pup is crouched down in the front with his backside up in the air. MORE FROM REFERENCE.COM Score: 0% Rank: Correct Answer: Start Quiz >>> Photo Courtesy: Fran/Pixabay

Man's best friend has a funny way of communicating sometimes, but almost everything your dog does has meaning. Your dog wants you to know that it loves you and is loyal. Like humans, dogs yawn when they are tired. Dogs can be roused relatively easily from a deep sleep, but do not wake them up if you think they're having a seizure. Yawning Yawning isn't a behavior that is hard to figure out. Some want to dig in the dirt to try and find a buried treasure, and some dig just because they're bored. Even if they are not hungry, the cat will drop the dead rodent at the feet of their human companion, seeking out praise for their services. That brings us to the butt sniff. For example, most breeds of both dogs and cats have fur to cover them and keep their skin safe from hot and cold weather in which they live. This is the animal being curious. However, if the animal feels threatened, you will see characteristics such as a tenseness between their shoulders, tucked tails, and tufts of fur sticking up along their back. When necessary, these different species of animals will hunt for their food if needed. If this medication comes out in the dog's stool, the animal may be enticed to gobble it back up, which is nothing short of gross. If you suspect your dog's anal glands are the issue, your groomer should be able to help. Growing and Baring Teeth When dogs bare their teeth and growl, they are showing aggression. Photo Courtesy: Kapas65/Pixabay

If the begging is getting out of hand, you may want to crate your pup or put it outside until the meal is over. When your dog pulls and the leash goes tight, you should stop walking. Make sure you introduce plenty of chewing options, and be stern when it comes to deterring your pup from chewing on things like the furniture. Begging You may notice your dog hanging around the dinner table looking all kinds of desperate for a taste of human food, but you should resist. Photo Courtesy: YamaBSM/Pixabay

However, your dog may also raise its paw because it wants you to pet it. Both dogs and cats are carnivorous animals. Your pet is attentive and wants to know if you have anything to say — especially if it involves a trip to the park! Butt Sniffing While most of the things that dogs do are cute, there are a couple that simply aren't. No matter how calm a dog's disposition is, a moment of aggression or fear can turn ugly quick. The worst-case scenario? They can also sneeze from allergies caused by grass and pollen. Getting exercise shouldn't be a stressful event for you or your dog, so this behavior needs to be squashed as soon as possible. Photo Courtesy: olliebrands0/Pixabay

Dogs also bark at the door if they sense that someone is outside. Photo Courtesy: stux/Pixabay

However, this also happens when something else is going on. Dogs chase their tails for a variety of reasons, but most of the time, it is all in good fun. From the need to carry themselves using four legs to the tail that each is born with, their body design helps them carry out their natural instincts for surviving in the world. Some dog and cat breeds have been modified through breeding practices humans have implemented throughout the years. Perhaps the animal sees something but is not quite sure if it's a threat or not. Dogs tilt their heads as a way to adjust their outer ears so that they can hear you better. Photo Courtesy: JACLOU-DL/Pixabay

A dog may also scoot his butt if there's something more serious going on. Survival Instincts It is the basic instinct for all living things to seek out food when they are hungry. MORE FROM FAQTODS.COM Photo Courtesy: ElnFox/Pixabay

Dogs should be socialized in a comfortable setting where they do not feel intimidated. For example, it is not uncommon for a cat to hunt a mouse or other type of rodent. By resting on your feet, the dog will be forced to wake up if you get up from your seat. Being a dog is just so ruff. They may begin to whine or bark while looking anxiously up at the table. Have you noticed that when you talk to your dog, it looks right at you and tilts its head? Photo Courtesy: MishuHanda/Pixabay

To keep your dog from jumping, be sure not to give the animal attention unless all four paws are on the ground. However, jumping is often frowned upon because a lot of people — especially strangers — do not want to be greeted with such enthusiasm. Dogs jump when they are happy, mainly because they are excited to greet another being. Photo Courtesy: Huskyherz/Pixabay

For example, nasal mites cause sneezing and some unpleasant nasal discharge. Dogs that are given a taste of food from the table will almost always beg for more. Whether your pet is lying right next to you or cooing up at your feet, this is entirely normal behavior. A dog may drag its behind if it's itchy or something is stuck there. Photo Courtesy: MAKY_0REL/Pixabay

No matter what the reason may be, eating grass is not a good thing. Photo Courtesy: JACLOU-DL/Pixabay

There isn't too much to worry about when your pooch lets out a big yawn. This could signify that your dog has worms or anal gland issues. Photo Courtesy: 889083/Pixabay

Many canine professionals will tell you that a dog that digs is one that needs to get some additional exercise. Photo Courtesy: Alexas_Fotos/Pixabay

A butt sniff is the equivalent of a human shaking another human's hand. Some dogs howl when they are sad or lonely, which can be absolutely heartbreaking. Your dog could be experiencing anything from frustration to aggression to a desire to play. For dogs, this may be found in simple acts, such as doing something on command. Yes, dogs sometimes sniff human butts, too. Chasing Their Tail Ah, the tail chase. Excessive licking can cause wounds, and that could lead to an infection, so do not take paw licking lightly. Sneezing Dogs sneeze due to irritants inhaled into their noses, not unlike humans. It's possible that your dog has fleas needs its anal glands checked and examined, especially if tail chasing is a frequent occurrence. Eating Grass Does your dog eat grass whenever it's outside? You may even say they're gross. This means that they need meat for iron, protein, and nutritional supplements to survive. You'll know this because the animal will likely put that raised paw on your arm. Photo Courtesy: 7138475/Pixabay

Sure, this isn't ideal, but the sentiment is still positive. This may be because the sound annoys the dog or hurts the animal's ears. Some dogs howl to mimic humans, like when they are singing or laughing. Low Growl A dog may express a low growl if it hears something but is unsure what it is. Photo Courtesy: Meli1670/Pixabay

Even older dogs enjoy chewing — it's just part of being a dog. Each of these animals understands who their predators are, allowing them to defend their territories as needed. Your dog is trying to get to know another dog — or a human. Frequent trips to a dog park or pet store help with adjusting to new scents and making friends. Cats and dogs have claws designed into their paws to give them tools for hunting and fighting off predators. Photo Courtesy: christels/Pixabay

While you can try to calm your dog by providing a distraction or speaking in a soothing tone, it's important that you are careful as well. Territorialism Dogs and cats will protect their territory. Photo Courtesy: dahancoo/Pixabay

It's also possible that your dog is trying to express itself in a different way. Photo Courtesy: Pitsch/Pixabay

In the event this is happening to your dog, you may want to try leaving for shorter periods of time, working up to longer times away. While cats tend to be more isolated with their territory, dogs tend to gravitate to other dogs to form a full pack. Your dog's love has no boundaries, so if you'd prefer to skip the mouth licks, you'll have to pull away. Licking or Biting Paws While licking a human to show love is a beautiful thing, a dog who licks his own paws could be experiencing something that requires a trip to the vet.
